

REMOTE VEHICLE TRACKING

Available to our corporate clients are sophisticated tracking devices that utilize the Global Positioning System (GPS). Placement of this device on a company vehicle allows remote tracking of that vehicle on a 24-hour basis for a day, a week or for extended periods of time when necessary.

The client is provided with a detailed street map with the vehicle route superimposed on the map or, if preferred, a printout of all locations visited by the company vehicle, as well as the length of stay at each location. This information can be invaluable in assessing if a company truck is making unauthorized deliveries, a salesman is effectively working his territory or if a disgruntled executive is having unexplained contact with competitors.

If sufficient time is available, the device can be placed in a manner that is almost impossible to detect unless major repair work is preformed on the vehicle. Use of this device also guarantees that your employee does not detect the "tail", while providing the necessary information for you to make informed decisions.

When use of the GPS System is impractical, vehicles can also be outfitted with electronic transmitters programmed to send signals to a tracking vehicle that can be as much as two miles behind the target vehicle or truck.
